

Integrating Security into Terraform IaC Pipelines

SHIFT-LEFT SECURITY FOR INFRASTRUCTURE AS CODE (IAC)

Adopting a Shift-Left Security Mindset

- ▶ Secure Terraform Development
- ▶ Local Security Validation
- ▶ CI/CD Security Automation
- ▶ Policy as Code

Learning Objectives

- ▶ Understand Shift-Left Security principles
- ▶ Secure Terraform workflows from development to deployment
- ▶ Implement local security scanning with pre-commit hooks
- ▶ Integrate security tools into CI/CD pipelines
- ▶ Enforce compliance using Policy as Code (OPA)

INTRODUCTION TO SHIFT- LEFT SECURITY

What is Shift-Left Security?

- ▶ Shift-Left Security means integrating security checks early in the software and infrastructure development lifecycle.
- ▶ Instead of treating security as a final hurdle before deployment, it empowers developers/Cloud and DevOps engineers to identify and resolve vulnerabilities while they are actively designing or writing code

Traditional Security Model

- ▶ Security happens after deployment.

Shift-Left Model

- ▶ Security happens during:
 - ▶ Development
 - ▶ Commit
 - ▶ Pull Request
 - ▶ CI/CD execution

Why Shift Left?

- ▶ **Cost Efficiency:** Fixing vulnerabilities in the planning or coding phase is significantly cheaper and faster than addressing them after the software reaches production.
- ▶ **Better Collaboration:** It bridges the gap between development, operations, and cybersecurity teams (often referred to as *DevSecOps*) making security a shared responsibility.
- ▶ **Faster Time-to-Market:** Catching errors early prevents late-stage pipeline delays or emergency rollbacks.

Why Shift Left for Terraform?

Risks in IaC

- ▶ Exposed secrets
- ▶ Open security groups
- ▶ Public S3 buckets
- ▶ Misconfigured IAM roles
- ▶ Compliance violations

Benefits

- ▶ Early detection
- ▶ Faster remediation
- ▶ Reduced deployment risk
- ▶ Improved compliance

Secure Terraform Pipeline Architecture

Security Layers

- ▶ DevOps engineer → Pre-commit → GitHub → CI/CD → Cloud

Security Controls

- ▶ Secret scanning
- ▶ Static analysis
- ▶ Policy validation
- ▶ Vulnerability scanning
- ▶ Dependency management

LOCAL SECURITY (PRE-COMMIT Hooks)

Why Local Security Checks Matter

Advantages

- ▶ Catch issues before commit
- ▶ Faster feedback loop
- ▶ Reduce CI/CD failures
- ▶ Improve developer responsibility
- ▶ Adhere to DevOps Research and Assessment (DORA) metrics.

Approach

- ▶ Use pre-commit hooks to automate checks locally.

Introduction to hooks in git

What are Hooks in git?

- ▶ Git hooks are custom scripts that run automatically whenever a specific event occurs in a Git repository.
- ▶ You can write hooks in Ruby or Python or whatever language you are familiar with
- ▶ Where to Find Them: Location: `.git/hooks/`

Client-Side Hooks:

- ▶ examples : pre-commit, prepare-commit-msg , commit-msg, pre-push, post-checkout

Server-Side Hooks

- ▶ examples: pre-receive, Update, post-receive

Introduction to Pre-Commit Hooks

What are Pre-Commit Hooks?

- ▶ Automated scripts executed before Git commits.

Benefits

- ▶ Consistent code quality
- ▶ Automated security scanning
- ▶ Standardized workflows

Local Security Toolchain Overview

Tool	Purpose
gitleaks	Secret detection
detect-secrets	Credential scanning
tflint	Terraform linting
checkov	Security & compliance scanning
terraform fmt	Formatting
terraform validate	Syntax validation

Gitleaks

What is Git leaks ?

Gitleaks is an open-source secret scanner for git repositories, files, and directories.

Git leaks Detects:

- ▶ API keys
- ▶ Tokens
- ▶ Passwords
- ▶ Credentials

Benefits

- ▶ Prevents accidental secret exposure
- ▶ Git history scanning
- ▶ Fast local feedback

detect-secrets

what is detect-secrets

- ▶ detect-secrets is an aptly named module for (surprise, surprise) **detecting secrets** within a code base

Features

- ▶ Baseline management
- ▶ False-positive reduction
- ▶ Incremental scanning

Why Use It Alongside gitleaks?

- ▶ Multiple detection approaches
- ▶ Better coverage

terraform fmt & validate

Code Quality Validation

terraform fmt

- ▶ Enforces consistent formatting

terraform validate

- ▶ Validates Terraform syntax and structure

Benefits

- ▶ Cleaner codebase
- ▶ Reduced syntax errors

TFLint

What is Tflint ?

- ▶ TFLint is an open-source, pluggable static analysis tool designed specifically for Terraform configuration files.

Tflint Detects

- ▶ Invalid configurations
- ▶ Deprecated syntax
- ▶ Provider-specific issues
- ▶ Naming inconsistencies

Benefits

- ▶ Best practice enforcement
- ▶ Improved code quality

checkov

What is Checkov?

- ▶ Checkov is an open-source static code analysis and software composition analysis (SCA) tool.

Checkov Detects

- ▶ Misconfigurations
- ▶ Compliance violations
- ▶ Security weaknesses

Examples

- ▶ Open ports
- ▶ Unencrypted storage
- ▶ Weak IAM policies

Sample Pre-Commit Workflow

Local Security Execution Flow

- ▶ DevOps writes code
- ▶ Git commit initiated
- ▶ Pre-commit hooks execute
- ▶ Security issues detected
- ▶ Commit blocked if failures exist

Example Pre-Commit Configuration

.pre-commit-config.yaml

Included Hooks

- ▶ gitleaks
- ▶ detect-secrets
- ▶ terraform fmt
- ▶ terraform validate
- ▶ tflint
- ▶ checkov

SECURITY IN CI/CD PIPELINE

Security in CI/CD Pipelines

- ▶ **Why Security in CI/CD Matters**
- ▶ Centralized enforcement
- ▶ Team-wide consistency
- ▶ Governance and auditing
- ▶ Prevent insecure deployments

CI Security Pipeline Stages

Pipeline Flow

- ▶ Code Push → formatting, validation, Linting → Security Scanning → Policy Checks → Approval → Deploy

Security Gates

- ▶ Block insecure merges
- ▶ Fail builds on violations

CI Security Toolchain Overview

Tool	Purpose
tflint	Terraform linting
checkov	IaC security scanning
Trivy	Vulnerability scanning
tfsec	Terraform static analysis
Terrascan	Policy enforcement
OPA	Policy as Code
Dependabot	Dependency updates

tfsec

What is tfsec?

- ▶ **tfsec** is an open-source static analysis security scanner specifically built for Terraform code.

tfsec Detects

- ▶ Public access risks
- ▶ Encryption issues
- ▶ Insecure defaults

Benefits

- ▶ Fast Terraform-focused scanning
- ▶ CI/CD friendly

Trivy

What is Trivy?

- ▶ Trivy is an open-source security scanner that detects misconfigurations, vulnerabilities, and secrets in Terraform code

Trivy Scans

- ▶ Terraform configurations
- ▶ Container images
- ▶ Dependencies
- ▶ OS packages

Benefits

- ▶ Multi-purpose security scanning
- ▶ DevSecOps integration

Terrascan

What is Terrascan

- ▶ Terrascan is an open-source static code analyzer that detects security and compliance violations in your Terraform code before you deploy it

Features

- ▶ Security compliance
- ▶ Cloud best practices
- ▶ Multi-cloud support

Common Standards

- ▶ CIS Benchmarks
- ▶ SOC2
- ▶ HIPAA
- ▶ PCI-DSS

Open Policy Agent (OPA)

What is Open Policy Agent (OPA)?

- ▶ Open Policy Agent (OPA) is an open-source, general-purpose policy engine that enables **Policy as Code (PaC)** for Terraform

Purpose

- ▶ Define organizational security policies programmatically.

Examples

- ▶ Prevent public S3 buckets
- ▶ Restrict open security groups
- ▶ Enforce tagging standards

OPA Workflow

Policy Enforcement Flow

- ▶ Terraform Plan → OPA Evaluation → Policy Decision

Outcomes

- ▶ Allow deployment
- ▶ Block deployment
- ▶ Generate compliance report

Dependabot

What is Dependabot?

- ▶ Dependabot for Terraform is an automated dependency management tool that monitors and updates your **Terraform providers** and **modules**

Features

- ▶ Dependency updates
- ▶ Vulnerability alerts
- ▶ Automated pull requests

Benefits

- ▶ Reduce outdated dependencies
- ▶ Improve supply chain security

Example CI Security Workflow

- ▶ **GitHub Actions Security Pipeline**

- ▶ Stages:
 - ▶ Terraform fmt
 - ▶ Terraform validate
 - ▶ tflint
 - ▶ checkov
 - ▶ tfsec
 - ▶ Trivy scan
 - ▶ OPA policy validation

Security Gates & Approval Workflows

- ▶ **Deployment Controls**
- ▶ Fail pipeline on critical findings
- ▶ Manual approval for production
- ▶ Security review requirements
- ▶ **Governance**
- ▶ Audit trails
- ▶ Compliance enforcement

IMPLEMENTING DEVSECOPS CULTURE

DevSecOps Principles

Core Concepts

- ▶ Security as shared responsibility
- ▶ Automation-first mindset
- ▶ Continuous monitoring
- ▶ Continuous compliance

Common IaC Security Misconfigurations

- ▶ Hardcoded secrets
- ▶ Open ingress rules
- ▶ Public storage buckets
- ▶ Excessive IAM permissions
- ▶ Disabled encryption

Best Practices for Secure Terraform Pipelines

Recommendations

- ▶ Scan locally before commit
- ▶ Automate CI security checks
- ▶ Use least privilege IAM
- ▶ Enforce policy as code
- ▶ Regularly update dependencies
- ▶ Monitor drift continuously
